Plain definition

AGE should begin as a narrow game-native product and expand only after the runtime, CAL, authoring, QA, and governance layers prove themselves.

Product wedge

The first product is a persistent, state-authoritative, natural-language game runtime with source-grounded rules arbitration for one bounded corpus.

Why gaming first

Gaming has complex rules, high query volume, ambiguity, human authority, version conflicts, and immediate feedback. It is structurally rich but low-stakes compared to professional domains.

Market expansion principle

AGE should not predetermine the first non-gaming professional market. Market readiness depends on corpus access, licensing, buyer urgency, liability tolerance, competition, and ROI. The architecture should remain portable while the MVP remains narrow.

Likely expansion sequence

- Game-native AGE runtime and Rules Service.
- Licensed entertainment corpora and creator tools.
- Serious play: training, wargames, simulations, education.
- Internal enterprise policy and technical documentation.
- Regulated or professional reference corpora where licensing and governance permit.
- Agent Service only after authority and audit maturity.

Rewards

The architecture can create a defensible product wedge, recurring corpus value, author ecosystem, serious-play applications, and downstream enterprise/professional optionality.

Risks

Scope creep, capital intensity, weak authoring UX, slow inference, licensing limits, marketplace quality, and premature professional claims.

Mitigation

Ship one bounded game-native system first. Treat every expansion as a new corpus, authority, licensing, and governance problem rather than a simple feature toggle.

MVP success criteria

A bounded adventure can be authored, played, rules-arbitrated, replayed, tested, and improved through human override capture.
